Study: Expression and purification of Fel d1 chain 1 and chain 2.

Project no.

Study no.

Fel d1 chain 1 (clone 42) and Fel d1 chain 2 clone 29 was ligated into pET 20b and electroporated into BL-21 DE3 pLysS after having been cut from pT7-Blue containing the correct sequence. (see binder HG1, Fel d1)
Sequencing of pET 42 / pET 29 was done accordig to standard protocol (ABI) and the result can be seen on the opposite side.

Both Fel d1 chain 1 (Fd1:1) and Fel d1 chain 2 (Fd1:2) was expressed according to standard protocol and purified on a thTrap (chelate) column loaded with $NiSO_4$.
Chain 1 was soluble, after ultrasonication chain 1 was found in 20 mM Tris HCl pH fraction, while chain 2 was found in the inclusion bodies after "washing" with 2M urea buffer + 20mM Tris HCl pH 8.0. The inclusion bodies were solubilized in 6M Guanidin, transferred to 6M Urea buffer (20mM Tris-HCl pH 8.0 + 0,5M NaCl) via 6 his HiTrap. Purification was done on FPLC

ELISA conditions

Coating of Fd 1:1 and Fd 1:2 (100 µl/well) over the weekend in +4°C. ~~Serum~~ 4 times wash with "Tvättlösning"

Patients serum was added, 100 µl/well and incubated at +4°C o.n. Wash 4 times (Wallac ELISA-washer) with "Tvättlösning" and 100 µl Rabbit/human ~~anti~~ IgE diluted 1000 times in "Vår buffert"

Inkubation 2 hours in RT on shaker, Wash 4 X "tvättlösning" and add 100 µl/well of Goat anti-rabbit-ALP konjugated (DAKO) for 1 h

Wash 4 times and add substrate 3 tablets/15ml of Vår buffert.

The result was read in ELISA reader after 45 min at 405 ~~nm~~ nm

Result: 2.5 µg/ml seem to be an adequate coating concentration for both chain 1 and chain 2. Mixing of the two chains can be done with coating concentrations 2.5 + 2.5 µg/ml

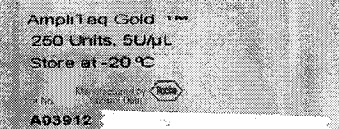
Result: One band of ~500bp which could be clone 1+2

The bands are cut out and purified on Qiagen

ligated with "perfectly blunt" cloning kit". 10 colonies are picked for miniprep and possibly sequencing



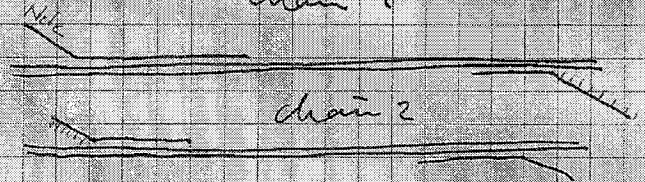
Study: Linking of (chain 1 and chain 2 (seamless)) with PCR Fel d1:1 and Fel d1:2

Project no.

Study no.

Aim. The aim of this ~~experiment~~ is to join the two chains of Fel d1 into one construct by PCR

Study outline The two sequenced chain of the major ~~chains~~ allergen of cat Fel d1 (chain 1, clone 42) and chain 2, clone 29) is joined with PCR i two steps as outlined below. In



template 42 (plasmid Fel d1:1 in pET-Blue)

templ 29 (pl. Fel d1:2 in pET-B)

Result (see opposite side)

Good bands of expected size was seen for both chain 1 and chain 2. But (2a) + (2b) as well as (4a) and (4b) did not work. I will confirm by adding (1a) to ~~template~~ 29 and do PCR. (chain 1+2)

Study: Ligation of Ed 1, clone 1 (2+1) and clone 5 (1+2) into pET 20b+ and electroporation into BL21 plys

cont. on page no:

Project no.:

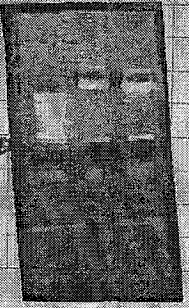
Study no.:

The fragments from Ed 1 (2+1) clone 1 and clone 5 (1+2) were ligen purified from 1% Agarose gel (248931)
A cleaved (Nde/Xho) pET 20b+ vector was used to ligate the fragments

Conditions

12 µl	~~vector~~ fragments
1.0 µl	vector
1.5 µl	10 mM ATP
1.8 µl	10x ligase buffer
1.7 µl	T4 ligase
18 µl	

Ligate +16°C o.n.
The ligate mix was electroporated into 50 µl BL21-plys electrocompetent cells. 1 µl ligate mix was added to thawed cells (on ice). Electroporation according to standard protocol. Growth on SOC medium for 60' 37°C shaker (300 rpm) and plated on Amp/CAM plates. One colony from each plate was picked and grown on LB Amp CAM liq. Mini prepped (Qiagen) and 25 µl of the (50µl) prep was cut with Nde and Xho. Result ~ 800bp



Both clones contain the insert !!
